## Definition

A polyomino is a planar figure made from one or more equal-sized squares, each joined together along an edge [S. Golomb (1953)].

# L-Tromino Tiling Problem

## Definition

## Definition

Given:

- A set of L-trominoes  $\Sigma$  called a **tile set**,  $\Sigma = \left\{ \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \right\}$

# L-Tromino Tiling Problem

## Definition

Given:

- A set of L-trominoes  $\Sigma$  called a **tile set**,  $\Sigma = \{ \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \}$
- and a polyomino  $R$  called **region**.

# L-Tromino Tiling Problem

## Definition

Given:

- A set of L-trominoes  $\Sigma$  called a **tile set**,  $\Sigma = \{ \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \}$
- and a polyomino  $R$  called **region**.

Goal: Place tiles from  $\Sigma$  to fill the region  $R$  covering every cell **without overflowing** the perimeter of  $R$  and **without overlapping** between the tiles.

# L-Tromino Tiling Problem

## Definition

Given:

- A set of L-trominoes  $\Sigma$  called a **tile set**,  $\Sigma = \left\{ \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \right\}$
- and a polyomino  $R$  called **region**.

Goal: Place tiles from  $\Sigma$  to fill the region  $R$  covering every cell **without overflowing** the perimeter of  $R$  and **without overlapping** between the tiles.

(a) A region  $R$

(b) A tiling of region  $R$

# Some Concepts

- In theoretical computer science, a computational problem is a mathematical object representing a collection of questions that computers might be able to solve.

# Some Concepts

- In theoretical computer science, a computational problem is a mathematical object representing a collection of questions that computers might be able to solve.
- Complexity classes are concerned with the rate of growth of the requirement in resources as the input increases.

# Some Concepts

- In theoretical computer science, a computational problem is a mathematical object representing a collection of questions that computers might be able to solve.
- Complexity classes are concerned with the rate of growth of the requirement in resources as the input increases.
- Time complexity is commonly estimated by counting the number of elementary operations performed by the algorithm, supposing that each elementary operation takes a fixed amount of time to perform.

# Some Concepts

- In theoretical computer science, a computational problem is a mathematical object representing a collection of questions that computers might be able to solve.
- Complexity classes are concerned with the rate of growth of the requirement in resources as the input increases.
- Time complexity is commonly estimated by counting the number of elementary operations performed by the algorithm, supposing that each elementary operation takes a fixed amount of time to perform.
- If the time complexity is polynomial in the input parameters, then we say that a problem can be solved in Polynomial time.

- NP is the set of decision problems for which the problem instances, where the answer is "yes", have proofs verifiable in polynomial time.

- NP is the set of decision problems for which the problem instances, where the answer is "yes", have proofs verifiable in polynomial time.
- A decision problem is a question asked to a computer which gives a yes/no answer.

- NP is the set of decision problems for which the problem instances, where the answer is "yes", have proofs verifiable in polynomial time.
- A decision problem is a question asked to a computer which gives a yes/no answer.
- NP-Hard: H is NP-hard when every problem L in NP can be reduced in polynomial time to H.

- NP is the set of decision problems for which the problem instances, where the answer is "yes", have proofs verifiable in polynomial time.
- A decision problem is a question asked to a computer which gives a yes/no answer.
- NP-Hard:  $H$  is NP-hard when every problem  $L$  in NP can be reduced in polynomial time to  $H$ .
- Example: given a set (or multiset) of integers, is there a non-empty subset whose sum is zero?

- NP is the set of decision problems for which the problem instances, where the answer is "yes", have proofs verifiable in polynomial time.
- A decision problem is a question asked to a computer which gives a yes/no answer.
- NP-Hard: H is NP-hard when every problem L in NP can be reduced in polynomial time to H.
- Example: given a set (or multiset) of integers, is there a non-empty subset whose sum is zero?
- An NP-complete decision problem is one belonging to both the NP and the NP-hard complexity classes.

- NP is the set of decision problems for which the problem instances, where the answer is "yes", have proofs verifiable in polynomial time.
- A decision problem is a question asked to a computer which gives a yes/no answer.
- NP-Hard: H is NP-hard when every problem L in NP can be reduced in polynomial time to H.
- Example: given a set (or multiset) of integers, is there a non-empty subset whose sum is zero?
- An NP-complete decision problem is one belonging to both the NP and the NP-hard complexity classes.
- Example: Subgraph isomorphism problem.

- The problem of tiling with trominoes was first studied by Conway and Lagarias who presented an algebraic necessary condition for a region in order to have a tiling.

- The problem of tiling with trominoes was first studied by Conway and Lagarias who presented an algebraic necessary condition for a region in order to have a tiling.
- C. Moore and J. M. Robson (2000) proved that deciding the existence of a L-tromino tiling in a given region is **NP-complete** with a reduction from **Monotone 1-in-3 SAT**.

- The problem of tiling with trominoes was first studied by Conway and Lagarias who presented an algebraic necessary condition for a region in order to have a tiling.
- C. Moore and J. M. Robson (2000) proved that deciding the existence of a L-tromino tiling in a given region is **NP-complete** with a reduction from **Monotone 1-in-3 SAT**.
- T. Horiyama, T. Ito, K. Nakatsuka, A. Suzuki and R. Uehara (2012) constructed a **one-one reduction** from **1-in-3 SAT**.

$$\Sigma = \{ \text{right-oriented 180-trominoes} \} = \left\{ \begin{array}{|c|c|} \hline & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline & \square \\ \hline \end{array} \right\}$$

or

$$\Sigma = \{ \text{left-oriented 180-trominoes} \} = \left\{ \begin{array}{|c|c|} \hline \square & \square \\ \hline & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \right\}.$$

## Definition

The **180-tromino tiling** problem only allows **180° rotations** of L-trominoes, i.e., the tile set can be

$$\Sigma = \{ \text{right-oriented 180-trominoes} \} = \left\{ \begin{array}{|c|c|} \hline & \square \\ \hline \square & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline & \square \\ \hline \end{array} \right\}$$

or

$$\Sigma = \{ \text{left-oriented 180-trominoes} \} = \left\{ \begin{array}{|c|c|} \hline \square & \square \\ \hline & \square \\ \hline \end{array}, \begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array} \right\}.$$

With no loss of generality, we will only consider **right-oriented 180-trominoes**.

## Theorem

If a region  $R$  **doesn't** contain a *rotated, reflected or sheared forbidden polyomino*, then *180-tromino tiling* can be computed in a *polynomial time*.

- ① *Hardness of tiling the Aztec rectangle with a given number of defects.* We saw that an Aztec rectangle with 0 or 1 defects can be covered with L-trominoes in polynomial time, whereas in general the problem is NP-complete when the Aztec rectangle has an unknown number of defects. It is open if there exists a polynomial time algorithm for deciding a tiling for an Aztec rectangle with a given number of defects.

- ① *Hardness of tiling the Aztec rectangle with a given number of defects.* We saw that an Aztec rectangle with 0 or 1 defects can be covered with L-trominoes in polynomial time, whereas in general the problem is NP-complete when the Aztec rectangle has an unknown number of defects. It is open if there exists a polynomial time algorithm for deciding a tiling for an Aztec rectangle with a given number of defects.
- ② *Tiling of orthogonally-convex regions.* In this work we showed several instances where a tiling can be found in polynomial time. In general, it is open if an orthogonally-convex region with no defects can be covered in polynomial time or if it is NP-complete to decide if a tiling exists.

# Enumeration of tilings

- We have not considered the problem of enumerating tromino tilings of the regions described in this talk. In general, there are no such formulas known in the literature for the shapes studied so far.

# Enumeration of tilings

- We have not considered the problem of enumerating tromino tilings of the regions described in this talk. In general, there are no such formulas known in the literature for the shapes studied so far.
- Some bounds can be given for the number ( $T(n)$ ) of L-tromino tilings of Aztec diamonds.

# Enumeration of tilings
